Manually install the Code42 client - Mac

Use the following instructions if you need to install Crashplan backup software on a Macintosh computer

Step-by-step guide

1. Download the current Code42 client using this link.
2. Open the DMG.
3. Click Install Code42 Crashplan. This will start the installation process.
4. The Installation Introduction will be displayed.
5. Click Continue.
6. The **Destination Select** screen will appear. Do not make any changes to the default destination provided, just click **Continue**.

7. The **Installation Type** selection window will appear and provide information about the amount of disk space that is needed.

8. Accept the default and continue the installation by clicking the **Install** button.

9. As the software is preparing to be loaded, it will require access to load and make some settings updates. In order to do this, it will require you to enter your computer login password. Typically, this is the password you use when you first sign into the machine and is NOT your netid password.
10. Enter your password then click the **Install Software** button. As the installation continues you will see a progress bar and the installation script status along with the time remaining for the installation to complete.

11. When the installation completes successfully you will be notified with the following message:

12. Your backup software is not setup and running for your Macintosh.
